

### Build

#### Automation

programmatically compiles, moves, packages, and prepares code for release.

### Why Build Automation?

- ✓ Less time on administrative tasks
- ✓ Increases reliability of deployments
- ✓ Catches build errors in advance
- ✓ Improves quality of software releases
- ✓ Reduces number of human errors
- ✓ Rapid feedback on how code changes affect the release

## The Challenge

Build and deployment processes are an area ripe for improvement in most enterprise IT environments. When building and deploying software involves manual effort, the process is typically expensive, time-consuming and error-prone. As your IT environment grows and as you face increasing pressure to deliver results with greater frequency and agility, these concerns become significant and noticeable.

Build automation helps your IT department cope with the challenges. With build automation, you can:

- Automate repetitive tasks around your deployment workflow such as moving files, executing scripts, and copying data
- Test deployment steps with precision and confidence in pre-production prior to final release
- Deploy and release with the push of a button
- Automatically deploy the latest release at regular intervals, or whenever the code is changed

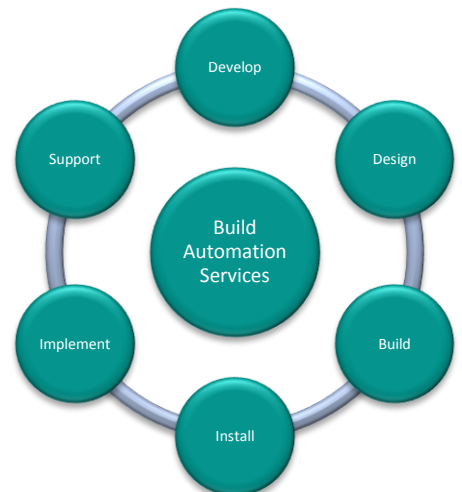

### Selected Build Automation Tools

## InfoCentric Offering

InfoCentric provides build automation services for both application development projects and information management projects. InfoCentric's build automation services include:

- Developing a build automation strategy
- Designing a customised build automation workflow
- Choosing the appropriate build automation platform
- Installing and setting-up build automation software
- Implementing your desired build automation workflow on your technology stack
- Supporting your build automation platform

### Engage with InfoCentric

Find out how InfoCentric can help you implement a practical, value-for-money Build Automation solution today.
